# Perceptive Context for Pervasive Computing

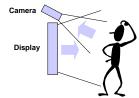

Trevor Darrell
Vision Interface Group
MIT AI Lab

## Perceptually Aware Displays

Camera associated with display

Display should respond to user

- font size
- attentional load
- passive acknowledgement

e.g., "Magic Mirror", Interval Compaq's Smart Kiosk ALIVE, MIT Media Lab

## Example: A Face Responsive Display

- Faces are natural interfaces!
  - Ubiquitous, fast, expressive, general.
  - Want machines to generate and perceive faces.
- A Face Responsive Display...
  - Knows when it's being observed
  - Recognizes returning observers
  - Tracks head pose
  - Robust to changing lighting, moving backgrounds...

#### A Face Responsive Display

#### Tasks

- Detection
- Identification
- Tracking

How? Exploit multiple visual modalities:

- Shape
- Color
- Pattern

#### Tasks and Visual Modalities

	shape	color	pattern
detection	silhouette classifier	skin classifier	face detection
identification	biometrics	flesh hue	face recognition
tracking	coarse motion estimation	clothing histogram	fine motion estimation / pose tracking

#### Mode and Task Matrix

	shape	color	pattern
detection	silhouette classifier	skin classifier	face detection
identification	biometrics	flesh hue	face recognition
tracking	Shape change	clothing histogram	Appearance change

#### **Finding Features**

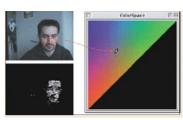

#### 2D Head / hands localization

- contour analysis: mark extremal points (highest curvature or distance from center of body) as hand features
- use skin color model when region of hand or face is found (color model is independent of flesh tone intensity)

#### Flesh color tracking

- Often the simplest, fastest face detector!
- · Initialize region of hue space

[ Crowley, Coutaz, Berard, INRIA ]

#### **Color Processing**

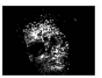

- Train two-class classifier with examples of skin and not skin
- Typical approaches: Gaussian, Neural Net, Nearest Neighbor
- Use features invariant to intensity
   Log color-opponent [Fleck et al.]
   (log(r) log(g), log(b) log((r+g)/2) )
   Hue & Saturation

#### Flesh color tracking

Can use Intel OpenCV lib's CAMSHIFT algorithm for robust real-time tracking.

(open source impl. avail.!)

[ Bradsky, Intel ]

#### Intel's computer vision library

#### Detection with multiple visual modes

Shape

Find head sized peaks in 2-D or 3-D.

Flesh Color Detection

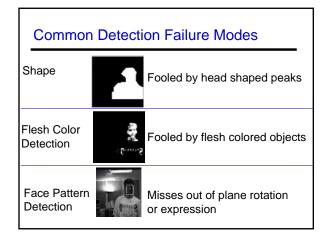

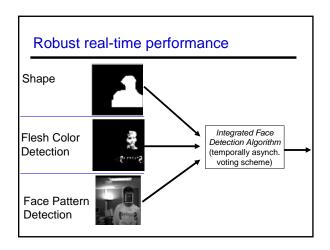

Detect skin pigment in hue-based color space

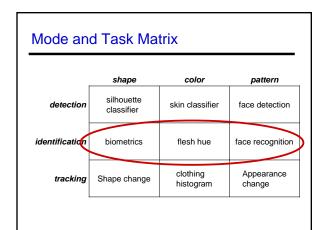

Face Pattern Detection

Classify intensity vector corresponding to face class

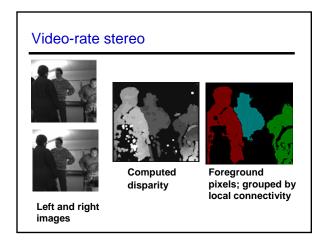

# A Key Technology: Video-Rate Stereo

- Two cameras -> stereo range estimation; disparity proportional to depth
- Depth makes tracking people easy
  - segmentation
  - shape characterization
  - pose tracking
- Real-time implementations becoming commercially available.

#### **RGBZ** input

## **RGBZ** input

#### Range feature for ID!

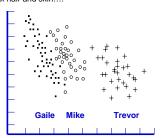

- Body shape characteristics -- e.g., height measure.
- Normalize for motion/pose: median filter over time

 Near future: full vision-based kinematic estimation and trackingactive research topic in many labs.

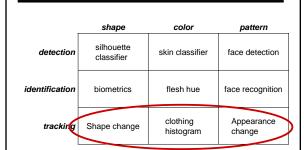

#### Color feature for ID!

For long-term tracking / identification, measure color hue and saturation values of hair and skin....

For same-day ID, use histogram of entire body / clothing

#### Mode and Task Matrix

See lectures by Trevor later in the course

## Robust, Multi-modal Algorithm

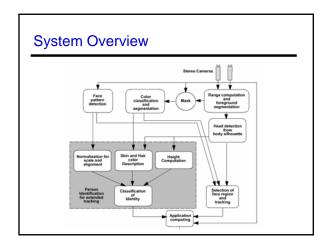

Combine modules for detection:

- Silhouette finds body
- Color tracks extremities
- Pattern discriminates head from hands.

Use each also to recognize returning people:

- Face recognition
- Biometrics (skeletal structure)
- · Hair and Skin hue
- Clothing (intra-day.)

[ CVPR '98; T. Darrell, G. Gordon, M. Harville, J. Woodfill ]

## Classic Background Subtraction model

- Background is assumed to be mostly static
- Each pixel is modeled as by a gaussian distribution in YUV space
- Model mean is usually updated using a recursive lowpass filter

Given new image, generate silhouette by marking those pixels that are significantly different from the "background" value.
