By ANTON TROIANOVSKI
 Besieged by an onslaught of
 sanctions that have largely un-
 done 30 years of economic inte-
 gration with the West in the space
 of two weeks, President Vladimir
 V. Putin on Thursday opened the
 door to nationalizing the assets of
 Western companies pulling out of
 Russia and exhorted senior offi-
 cials to "act decisively" to pre-
 serve jobs.

Russian Leader Facing Generation-Defining Economic Crisis

"I have no doubt that these
 sanctions would have been imple-
 mented no matter what," Mr.
 Putin said in televised remarks on
 Thursday, arguing that his inter-
 vention in Ukraine served merely
 as a pretext for the West to try to
 wreck Russia's economy. "Just as
 we overcame these difficulties in
 years past, we will overcome
 them now, too."
 But the sanctions imposed in
 the two weeks since the invasion
 — combined with multinational
 companies that employ tens of
 thousands of Russians voluntarily

how to build software?
two problems to solve

functional structures

is it usable? effective? fit for purpose?

software design

implementation structures

is it robust? performant? maintainable?

software engineering

The rôle of a formal functional specification is simply to act as a logical firewall between two completely different concerns... The **pleasantness problem** concerns the question whether a system meeting such-and-such a formal functional specification would satisfy our needs, meet our expectations and fulfill our hopes. The **correctness problem** concerns the question whether a given design meets such-and-such a formal functional specification.

Dijkstra, EWD952 (1986)

ESSAYS ON SOFTWARE ENGINEERING

THE MYTHICAL MAN-MONTH

FREDERICK P. BROOKS, JR.

Conceptual integrity is the most important consideration in system design.

Fred Brooks, *Mythical Man Month* (1975)

I am more convinced than ever. Conceptual integrity is central to product quality.

Mythical Man Month Anniversary Edition (1995)

The essence of a software entity is a construct of interlocking concepts... I believe the hard part of building software to be the specification, design, and testing of this conceptual construct, not the labor of representing it...

No Silver Bullet (1986)

When you go to design a house **you talk to an architect first**, not an engineer. Why is this?

Because the criteria for what makes a good building fall outside the domain of engineering.

Similarly, in computer programs, the **selection of the various components** and elements of the application must be driven by the conditions of use. **How is this to be done?** By software designers.

A Software Design Manifesto
Mitchell Kapor, 1996
paraphrasing slightly

**what makes
great designers?**

design by inspiration

inspiration = talent + process

problem at hand defines context

is there any great design that is the result of a great design process?

design by expertise

expertise = patterns + design moves

familiar structures

familiar steps

The well-kept secret behind the most successful designs is that they are less new than they appear. Invariably, it turns out that, in some form or other, the designer has done the same thing before. —AFD

you might find helpful an annotated version [0] of Hoare's explanation of JSP that I edited for a Michael Jackson festschrift

I'd point to these ideas as worth knowing:

...ing problem that involves traversing ... structures can be solved very systematically. HTDP addresses this class, but bases code structure only on input structure; JSP synthesized it.

- The archetypal problems that, however you code, can't be pushed under the rug—most notably structure clashes—and just recognizing them

- Coroutines (or code transformation) let you structure code more cleanly when you need to read or write more than one structure. It's why real iterators (with yield), which offer a limited form of this, are (in my view) better than Java-style iterators with a next method.

- The idea of viewing a system as a collection of asynchronous processes (Ch. 11 in the JSP book, which later became JSD) with a long-running process for each real-world entity. This was a notable contrast to OOP, and led to a strategy (seeing a resurgence with event storming for DDD) that began with events rather than objects.

... this brings back memories! In the late eighties I, as a teenager, found a Jackson Struct. Pr. book at the town library. I remember I was amazed at the text and wondered why I hadn't heard about the method before.

If I remember correctly did the book clearly point out backtrack standard method, while mentioning that most languages lacked that, so it had to be implemented manually.

This is referenced(1) as a core inspiration in the preface to "How to Design Programs" but i never researched it further because i've found the "design recipes" approach in htdp to be pretty solid in real life problems
